STACKS & QUEUES

IMPLEMENTATION
PATTERN TO ANSWER
PRACTICE PROBLEMS
APPLICATIONS

Stack

Stack is linear data structure, in which element is inserted from TOP of stack & removed from TOP of stack.

It mainly follows, LIFO (Last In First Out) or FILO (First In Last Out) order.

Operations on Stack

Push: To insert an element.

Pop: To remove an top element.

Top: Returns the topmost element.

Is Empty: Tells whether stack is empty or not.

* All the operations are performed
in $O(1)$

✓ push(10) ✓ push(20) ✓ push(30) pop Top ✓
is Empty ✓ pop pop is Empty

Output: 20
false
true

Applications on Stack

- 1.Reverse the String*
- 2. Infix to Postfix*
- 3. Prefix to Postfix*
- 4. Balanced Parenthesis*
- 5. Recursion Activation Stack Record*

Stack in STL

Header file: include <bits/stdc++.h>

```
stack <int> st;  
  
// push  
st.push(10); // Push at top of stack  
  
// pop  
st.pop(); // remove top element  
  
// top  
st.top(); // returns top element  
  
// is empty  
st.empty(); // check if stack is empty
```

Stack in JAVA Collections

```
ArrayDeque <Integer> st = new ArrayDeque<>();  
  
// push  
st.push(e: 10); // Push at top of stack  
  
// pop  
st.pop(); // remove top element  
  
// top  
st.peak(); // returns top element  
  
// is empty  
st.isEmpty(); // check if stack is empty
```

Implementing Stack

```
void push (int data)
{
    if (top == N-1)
    {
        overflow
    }
    ++top
    st[top] = data
}
```

top

80	5
70	4
60	3
40	2
20	1
10	0
	-1

Implementing Stack

pop
(Remove top element)

```
void pop()  
{  
    if (top == -1)  
        underflow  
    }  
    top = top - 1  
}
```

peek()

if (top == -1) return

print (st[top])

Empty()

if (top == -1) return true

return false

	5
70	4
60	3
40	2
20	1
10	0
	-1

```
void traverse ()  
{
```

```
    if (top == -1)  
        return
```

```
    for (i = 0 : i ≤ top : i++)  
    {  
        print (st[i])  
    }
```

```
}
```

top

	5
70	4
60	3
40	2
20	1
10	0
	-1

Hint

Re-do

Given a string `s` containing just the characters `'('`, `')'`, `'{'`, `'}'`, `'['` and `']'`, determine if the input string is valid.

An input string is valid if:

1. Open brackets must be closed by the same type of brackets.
2. Open brackets must be closed in the correct order.
3. Every close bracket has a corresponding open bracket of the same type.

Example 1:

Input: `s = "()"`

Output: `true`

Example 2:

Input: `s = "()[]{}"`

Output: `true`

Example 3:

Input: `s = "[]"`

{ () []) } {

if open bracket
- push in st

if closing bracket

$\text{check}(\text{st.top}(), s[i])$

stack

top s(i)

{ () []) } {

```
bool isBalanced (string s)
{
    stack < char> st
```

```
    for (i=0 ; i<n ; i++)
```

```
    {
        if ( s(i) == '(' || s(i) == '[' || s(i) == '{' )
        {
            st.push ( s(i) )
```

```
        }
        else {
            if ( isCheck ( st.top(), s(i) )
                    st.pop() )
```

```
            }
            else
                return false
```

```
    }
    return st.empty ()
```

Monotonic Stack

Next Greater Element

Difficulty: **Medium**

Accuracy: **32.95%**

Submissions: **464K+**

Points: **4**

Average Time: **20m**

Given an array **arr[]** of integers, the task is to find the next greater element for each element of the array in order of their appearance in the array. Next greater element of an element in the array is the nearest element on the right which is greater than the current element.

If there does not exist next greater of current element, then next greater element for current element is -1. For example, next greater of the last element is always -1.

Examples

Input: arr[] = [1, 3, 2, 4]

Output: [3, 4, 4, -1]

Explanation: The next larger element to 1 is 3, 3 is 4, 2 is 4 and for 4, since it doesn't exist, it is -1.

Input: arr[] = [6, 8, 0, 1, 3]

Output: [8, -1, 1, 3, -1]

Explanation: The next larger element to 6 is 8, for 8 there is no larger elements hence it is -1, for 0 it is 1, for 1 it is 3 and then for 3 there is no larger element on right and hence -1.

```
for (i=0 : i<n : i++) (N)
{
```

6	8	0	1	3
0	1	2	3	4

```
    for (j=i+1 : j<n : j++) (N-1)
    {
        if (a[i] < a[j])
        {
            print (a[j])
            break
        }
    }
```

```
    if (j == N)
        print (-1)
```

```
}
```

6	8	0	1	3
0	1	2	3	4

pen

cur

top

$$8 > 0$$

$$8 \xrightarrow{\text{N4E}} \underline{\underline{-1}}$$

Stack

```
vector<int> NGE(arr, N)
```

```
{    vector<int> ans
```

```
    stack<int> st
```

```
    for (i = N-1; i ≥ 0; i--)
```

```
    {
```

```
        if (st.empty())
```

```
        {
```

```
            push(a[i])
```

```
        }
```

```
    } else {
```

```
        while (!st.empty() && a[i] ≥ top())
```

```
        {
```

```
            st.pop
```

```
        }
```

```
        if (st.empty())
```

```
            ans.push(-1)
```

```
        else
```

```
            ans.push(top())
```

```
    }
```

```
}
```

```
}
```

```
ans.push(-1)
```

Reverse the string using Stack

You are given a string, print it in reverse order.

string: stackiseasy

output: ysaesikcats

ysaesikcats

Stack diagram showing the reverse of the string "stackiseasy":

- Top of stack: y
- Second from top: s
- Third from top: a
- Fourth from top: e
- Fifth from top: s
- Sixth from top: i
- Seventh from top: k
- Eighth from top: c
- Ninth from top: a
- Tenth from top: t
- Bottom of stack: s
